Professional Philosophy

Senior Software Developer with an **architectural** and **devops** focus with 10+ years of experience. Worked on **B2B**, **B2C**, **IPaaS** and **SaaS** solutions.

I am not a ticket-mover; I am a **standard-setter**.

Building **deterministic**, **explicit** systems where others would rely on implicit "magic." Driven by a relentless focus on optimization and elegance, I reject "good enough" in favor of robust, future-proof architecture.

I bring a senior-level depth that transforms development teams to powerhouses that can deliver applications and code as needed, where needed.

I am brutally focused on **code quality**, pushing for fully decoupled architectures and testable, beautiful code. **I refuse to be a passive implementer**; I actively redesign complex legacy systems into performant, scalable engines.

Whether it's introducing new paradigms or mentoring juniors in SOLID principles, my goal is to leave both the codebase and the team significantly smarter than I found them

Tech Stack

Infrastructure & Runtime

- **Systems:** Linux (Arch, Debian, Ubuntu), Docker, Kubernetes.
- **Web Server & Proxies:** Nginx, Apache, PHP-FPM, Traefik
- **DevOps:** CI/CD Pipelines, Makefile optimization, Custom Docker Stacks.

Data & Inter-Process Communication

- **Messaging & Streaming:** RabbitMQ, NATS, Redis.
- **Persistence:** MySQL, MSSQL, MongoDB, SQLite.
- **Observability:** OpenTelemetry, Jaeger, Datadog.

Backend Engineering

- **Core Languages:** PHP (Symfony, Laravel, PimCore), Python, Go, C#, C, JavaEE.
- **Key Concepts:** Generators, Closures, Mutexes, Stream Handling.
- **Tools:** GIT, PHPStan, CS-Fixer, Psalm, ...

Architecture & Standards

- **Methodologies:** DDD, CQRS, Event-Driven Architecture, TDD, SOLID.
- **Design Patterns:** (Explicit) Dependency Injection, Middlewares, Service Locators, Active Record vs Data Mapper.
- **Parsing:** Natural Language Interpretation, BNF.

Professional Experience

(Lead) Developer @ X20 – Current Role | Sept 2024 – now

Refactoring legacy systems into explicit, decoupled microservices while stabilizing infrastructure.

The Price Engine: Designed a **high-performance, fully configurable** pricing engine decoupling the platform from Tilroy. Leveraged **PHP Generators** and abstract subprocessors to handle complex discount logic **without code churn**.

Infrastructure Rescue: Reworked the entire **Docker/Kubernetes stack**. Fixed race conditions in boot orders, implemented correct **healthchecks**, and introduced private networks with **NGINX sidecars** to solve critical routing issues.

Standardization: Upgraded the Common bundle, a battle-tested library of generic components (Collections, Strict Serialization, Enums) to enforce **type safety** and reduce boilerplate across services. Implemented Bundles and Contracts for Service to Service interaction.

Observability: Implemented a custom OtelBundle to **standardize tracing and metrics** collection (Datadog/Jaeger) across the fleet.

Software Engineer @ Qlik | Nov 2020 – July 2024

Acquired via Blendr.io. Transitioned from core engineering to architectural standard-setting.

Runtime Architecture: Redesigned the **Low-Code Runtime Environment**, moving from simple compilation to a **Dependency Injected, interpretation-based engine**.

API Governance: Selected for the "API-DESIGN" team to define company wide standards for REST naming conventions, data formats, and NATS messaging schemas.

DevEx Champion: Drove the "Docathon" initiative and enforced coding guidelines to improve developer velocity and onboarding.

Backend Engineer @ BLENDR.IO | Nov 2019 – Mar 2022

Core engineering for an iPaaS solution, scaling from PoC to Acquisition.

Monolith Decomposition: Drove the architectural split of the monolith into **scalable microservices**.

Core Logic: Single-handedly implemented **Native File Support and Stream handling**, ensuring low-memory footprint processing of large datasets.

Infrastructure: Created the initial CloudFormation stacks for AWS deployment and introduced PSR-11 Containers to manage dependency resolution explicitly.

Previous Engagements (Summary)

Application Developer @ IController (2018): Focused on code optimization, eliminating "code rot" and improving data import modules.

Consultant @ PHPRO (2017 - 2018): Performance analysis and module development for enterprise clients (Multipharma, Bel&Bo).

Application Developer @ Three-Sixty Media (2015 - 2017): Engineered a custom **Active Record/ORM** system and successfully normalized dynamic MySQL databases.

Early Career (2011 - 2014): Full-stack development for SurveyAnyplace, SumoCoders, and AB0-Service, focusing on API design and framework maintenance.

Education and Certifications

Software Architecture & Technology of Large-Scale Systems (Udemy, 2022)

Guide to Software Architecture (Udemy, 2022)

IB0 Full Stack Webapplication Developer (SurveyAnyplace, 2013)

Java EE Developer (Cevora, 2012)

IB0 Web Developer and Designer (AB0Service, 2011)
